

C# tarea inicial

Brayner José Melo Adames, 2025-0933, viernes a las 6:00PM

1. Declarar variable de los diferentes tipos, asignarles valor e imprimir el valor.

```
Program.cs
1 string studentFullName = "Brayner Jose Melo Adames";
2 ushort studentAge = 18;
3 double personHeightInFeet = 5.10;
4 int weightInPounds = 174;
5 float piApproximation = 3.14159f;
6 sbyte favoriteDigit = 7;
7 char firstInitial = 'B';
8 bool isEnrolled = true;
9
10 Console.WriteLine("Student Data Profile");
11
12 Console.WriteLine("Full Name: " + studentFullName);
13 Console.WriteLine("Age (Years): " + studentAge);
14 Console.WriteLine("Height (Feet): " + personHeightInFeet);
15 Console.WriteLine("Weight (Pounds): " + weightInPounds);
16 Console.WriteLine("Pi Approximation: " + piApproximation);
17 Console.WriteLine("Favorite Digit: " + favoriteDigit);
18 Console.WriteLine("First Initial: " + firstInitial);
19 Console.WriteLine("Currently Enrolled: " + isEnrolled);
20
21 Console.ReadKey();
```

Student Data Profile
Full Name: Brayner Jose Melo Adames
Age (Years): 18
Height (Feet): 5,1
Weight (Pounds): 174
Pi Approximation: 3,14159
Favorite Digit: 7
First Initial: B
Currently Enrolled: True

2. Buscar cómo se declara una constante en C# e imprimir el valor. Probar de cambiar su valor luego y ver que es lo que pasa.

```
Tarea1
1 const long SPEED_OF_LIGHT_MPS = 299792458;
2 Console.WriteLine("Speed of Light (m/s): " + SPEED_OF_LIGHT_MPS);
3 SPEED_OF_LIGHT_MPS = 300000000;
```

Hot Reload - Unable to build changes

Your changes resulted in build errors:

- ✖ Cannot apply changes -- unexpected error: 'An item with the same key has already been added. Key: <top-level-statements-entry-point>'

More information: [Error List](#) | [Hot Reload Output](#)

[Edit](#) [Disable](#) [Stop](#)

Este error ocurre debido a que una constante solo se puede definir una vez. Intentar asignarle un valor por segunda vez es lo que causa el error. Solo se le puede cambiar el valor a una variable, y una constante, por definición, no es una variable.

3. Declara un entero, incrementarlo, decrementarlo, hacer operaciones con el.

```
Tarea1
1 int mainNumber = 7;
2 int secondOperand = 5;
3
4 mainNumber++;
5 Console.WriteLine("Increment: " + mainNumber);
6
7 mainNumber--;
8 Console.WriteLine("Decrement: " + mainNumber);
9 Console.WriteLine();
10
11 double sum = mainNumber + secondOperand;
12 double subtraction = mainNumber - secondOperand;
13 double multiplication = mainNumber * secondOperand;
14 double division = (double)mainNumber / secondOperand;
15 int modulo = mainNumber % secondOperand;
16
17 Console.WriteLine("Operations:");
18 Console.WriteLine();
19 Console.WriteLine("Sum: 7 + 5 = " + sum);
20 Console.WriteLine("Subtraction: 7 - 5 = " + subtraction);
21 Console.WriteLine("Multiplication: 7 x 5 = " + multiplication);
22 Console.WriteLine("Division: 7 / 5 = " + division);
23 Console.WriteLine("Module: 7 % 5 = " + modulo);
24
25 Console.ReadKey();
```

Increment: 8
Decrement: 7

Operations:

Sum: 7 + 5 = 12
Subtraction: 7 - 5 = 2
Multiplication: 7 x 5 = 35
Division: 7 / 5 = 1,4
Module: 7 % 5 = 2

C# tarea inicial

4. Declarar un float con valor=10152466.25. Declara un byte que es igual a 5 + el float.

Podemos apreciar que nos da error al tratar de ejecutar esta secuencia de código, esto sucede debido a que la cantidad de espacio disponible en un Byte no es suficiente para almacenar un Float.

5. Adjuntar comentario de una y de varias líneas un su código. Imprimir la fecha y hora d el sistema.
